

WHITE JAMUN

Place of origin is temperate and tropical areas of Asia. This fast-growing fruit crop bears twice a year and provides support to apiculture because it remains in bloom for a long period in a year. Apart from being a fruit crop it goes well with landscaping designs. It performs better in well-drained soil and ample exposure to sunlight but with the single limitation of the inability to withstand long draught. Fruits are cylindrical in shape and the usual practice is to consume them without peeling off skin and removing the embedded seed while chewing.
